Introdução

O que o programa faz

Biblioteca is the catalogue of your personal library. For each book it keeps the title, the authors, the subjects, the year, the country it comes from, where the copy is in your home, whether it is on loan, the cover photo and your own notes. From that you can search any of those fields, filter, print a book's record, export the selection to Excel, and see on a map where what you read comes from. This is the Mac version. It is an ordinary application, with its own icon and window — it is not a website. The internet is only used when you ask for it: looking a book up by ISBN, or fetching a cover. The same catalogue is read by the Windows, iPhone and Android apps, because all four write to the same file.

Informações de entrada

A text file called biblioteca.txt, which is your library. Each line is a book, with the fields separated by tabs — the TSV format. If you keep that file in a Biblioteca folder inside iCloud Drive, the app finds it by itself the first time it opens. If not, it asks. And if you do not have that file yet, you do not need to create it elsewhere: the first-run window creates one for you. The chapter "The first time you open it" shows how. Beside it, optionally, a biblioteca.dat with the cover photos and a grupos.json with the names of your reading groups. All three live in the same folder, and the app looks after all of them.

Resultados produzidos

biblioteca.txt itself, rewritten on every change — there is no save button, and nothing is left pending. On demand: a book's record for printing, a search report with the filters you used written at the top, an .xlsx spreadsheet with the selected books, and the biblioteca.dat with the covers. And, without your asking, backups in a Backups folder beside your file: 30 generations of the .txt and 7 of the .dat.

■ *Voltar ao Sumário*

Instalação

Biblioteca for the Mac comes in a .dmg file of about 2 MB. It needs nothing installed beforehand and works on macOS 13 Ventura or newer. The app is recognised by Apple, so it opens straight away, with no security warning.

macOS 13 Ventura or newer

Installing is the usual Mac routine: open the .dmg and drag the app into the Applications folder.

1. Download Biblioteca-Mac.dmg from https://ruggierow.github.io/biblioteca/ and double-click it.
2. Drag "Biblioteca Web" into the Applications folder, as usual.
3. If you already had the previous version, confirm the replacement. Your biblioteca.txt and biblioteca.dat are not touched.
4. Eject the installer disk and open the app from Launchpad or from the Applications folder.

Como confirmar que a instalação funcionou

The app opens in a window with a blue-and-green gradient header, the name "Personal Library Manager" and the version beside it. If your library already existed, the list shows up filled in at the bottom of the page, with the count to the right of the "Book list" heading. If this is the first time, the "Welcome" window appears on top and asks where your books should live.

■ *Voltar ao Sumário*

The window and the language

Everything happens on a single page, which you go through from top to bottom: first adding a book, then search, editing, the indexes, the map, the file and, last, the book list. The header stays visible at the top, with the language selector and the quit button.

Passo a passo

1 To change the language, click the selector in the top right corner and choose Português or English.

2 The change takes effect at once, without restarting the app, and is remembered for the next time you open it.

3 To close, use the "Quit" button in the header — it writes anything pending before leaving.

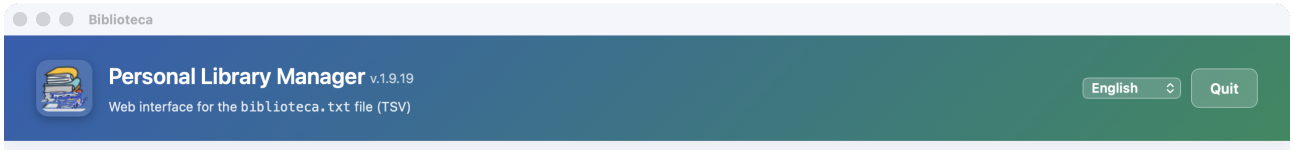

Figura 1: The header, with the language selector and the Quit button

Exemplos de uso

- The first time you open the app, the language follows the Mac's: on a Mac in Portuguese it opens in Portuguese; in any other language, it opens in English.
- Once you pick a language in the selector, your choice always wins — even if the Mac is set to another language.

■ *Voltar ao Sumário*

The first time you open it: where your books will live

This is the one screen you see only once. It appears while the app does not know any library of yours yet, and it exists to answer a question nobody should have to work out alone: I do not have a biblioteca.txt yet — how do I make one? The answer is that you do not have to create it elsewhere. The first of the three choices creates the file for you, wherever you choose.

Passo a passo

1. "Choose or create a file" is the recommended option and the one for someone starting out. It opens the Mac's save window: pick the folder, confirm the name biblioteca.txt, and that is it — the file now exists and the app writes to it from then on.
2. If you already have a biblioteca.txt from another computer, use "Import an existing file" and point at it.
3. "Decide later" closes the window without linking anything. You can still add books, but they are kept only inside the app, not in a file of your own.
4. Chose "Decide later" and changed your mind? The same thing is in the "The biblioteca.txt file" band, under "Link folder".

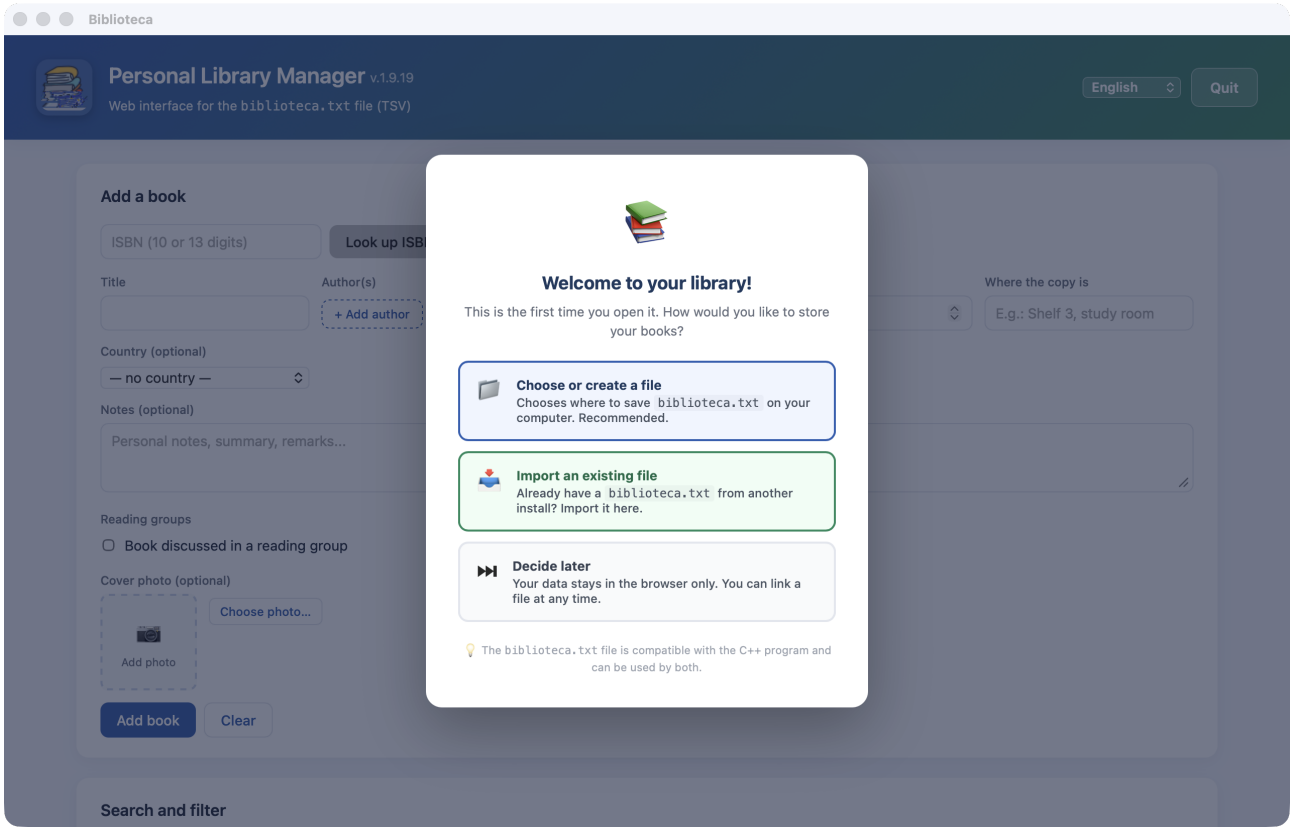

Figura 2: The first-run window, with its three choices

Exemplos de uso

- Where to keep it: if you use the app on more than one device, put the file in a folder called Biblioteca inside iCloud Drive. That is the place the app looks by itself, and it is what makes the iPhone and the Mac see the same collection.

- And biblioteca.dat, for the covers? It is not born with the other one. It only comes into existence once you have covers and use "Export photos → iCloud Drive". Until then nothing is missing: the app works without it.
- This window does not appear on Windows. There the app creates the file by itself, without asking.

■ *Voltar ao Sumário*

Adding a book

It is the first block on the page. It adds a book to the catalogue, and the least you need is the title.

Passo a passo

1. If you have the ISBN at hand, type it in the first field and click "Look up ISBN": the title, the authors and the year come filled in from the internet.
2. Fill in or correct the Title. It is the only required field.
3. Click "+ Add author" once for each author, and "+ Add subject" once for each subject.
4. Fill in the Year, Where the copy is (where the book sits in your home) and, if you like, the Country.
5. Use Notes for whatever is yours: a summary, a memory, who gave you the book.
6. If the book was discussed in a reading group, tick the box and choose the groups.
7. Under "Cover photo", click "Choose photo..." to pick an image from the computer.
8. Click "Add book". The book shows up in the list and the file is written at once.

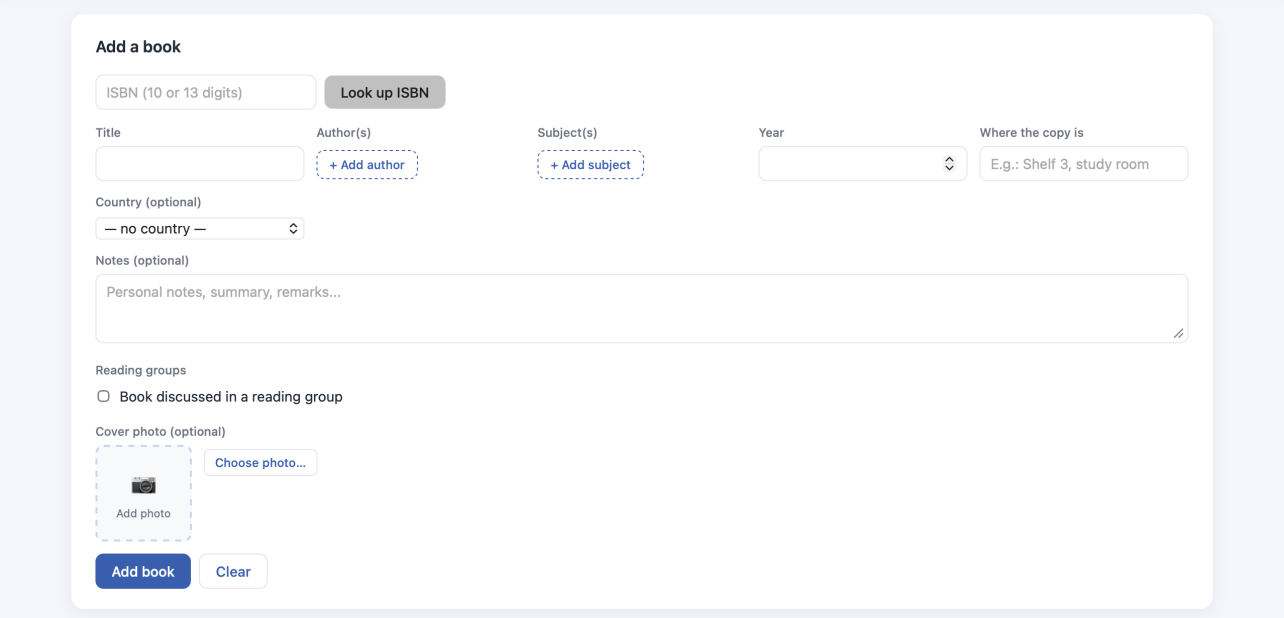

Figura 3: The add-a-book form, with every field of a book

Exemplos de uso

- Quick entry: type only the title and click Add book. The other fields can be filled in later, by editing.
- Entry by ISBN: type 9788535902778 and click Look up ISBN. Check what came back — the lookup almost always gets the title right, but it sometimes gives the author's name in a different order from yours.
- The "Clear" button empties the form without adding anything, handy when you give up halfway.

■ *Voltar ao Sumário*

Searching and filtering

The "Search and filter" block looks for parts of words in four fields at once, and also filters by status, reading group and whether there is a photo. The filters add up: the more you fill in, the narrower the result.

Passo a passo

1. Type a piece of what you are looking for in Title, Author, Subject or Location — it need not be the whole word, and case does not matter.
2. Under Status, choose between all, available or on loan.
3. Under Reading group, choose a group to see only the books discussed in it.
4. Tick "With photo" to see only the books that already have a cover.
5. Click "Search". The list at the bottom of the page now shows only the result.
6. "Clear filters" gives the whole list back.

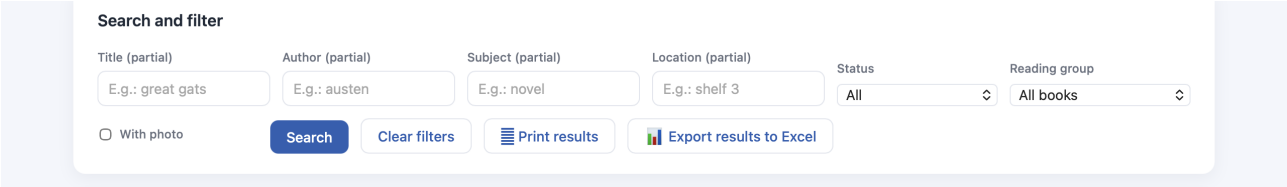

Figura 4: The search fields and the print and export buttons

Exemplos de uso

- Search by author: type "machado" in Author and click Search — every book by Machado de Assis comes back, even if you entered the full name.
- Find a book on the shelf: type "shelf 3" in Location to see everything kept there.
- Two filters together: "novel" in Subject plus Status "On loan" shows which novels are out of the house.
- With the result on screen, "Print results" makes a report with the filters you used written at the top, and "Export results to Excel" saves the same selection as a spreadsheet.

■ *Voltar ao Sumário*

Editing a book

This is for correcting an entry. The "Edit book" block has a list of every book and a field to narrow it as you type; the form opens in a window on top of the page.

Passo a passo

1 Type part of the title, the author or the subject in "Filter the list by title, author or subject".

2 Pick the book in the "Book to edit" list.

3 Click "Edit selected". The window opens with the current details filled in.

4 Change what you need and click "Save". "Cancel" closes without writing anything.

5 The same window opens from the "Edit" button on the book's row, in the table at the bottom of the page — usually quicker when you are already looking at the list.

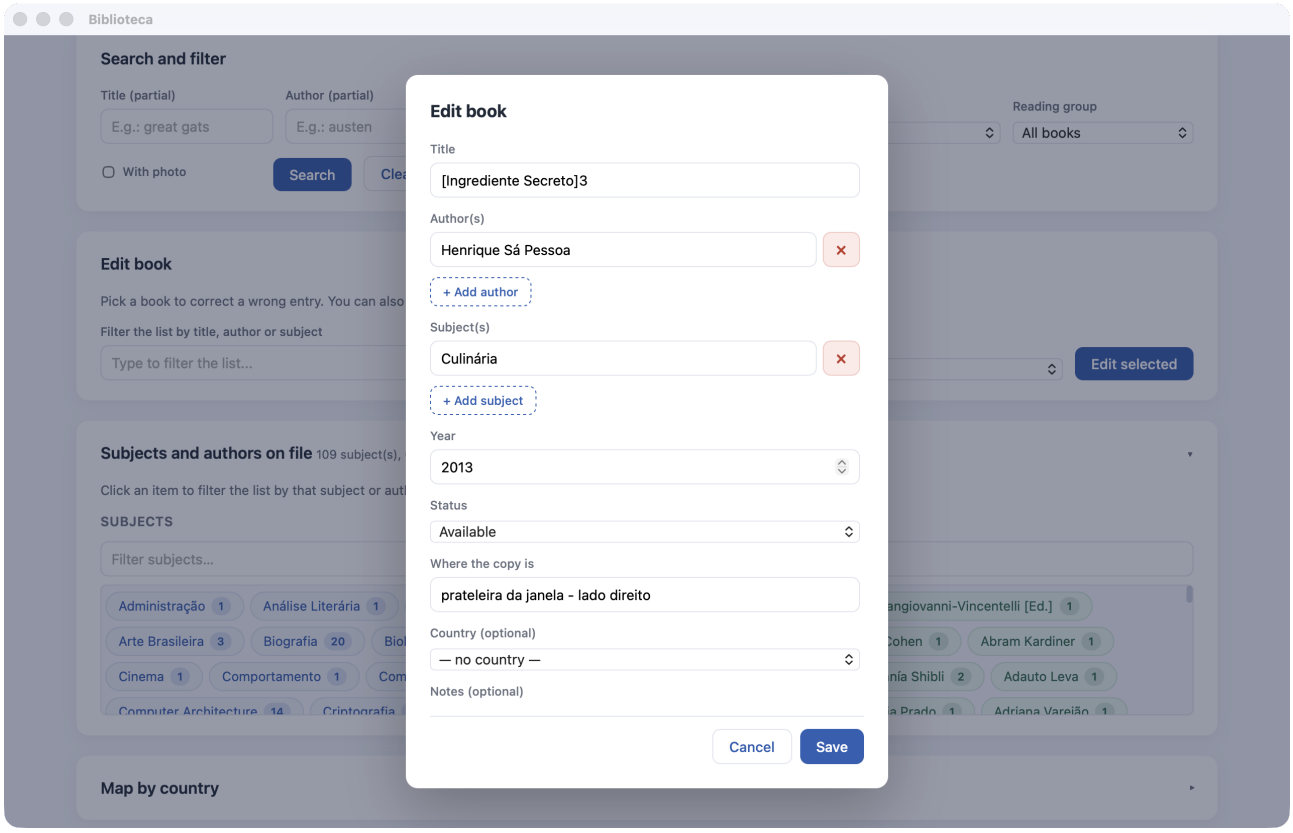

Figura 5: The edit window, open over the page

Exemplos de uso

- Fix a wrong year: filter by the title, select it, edit the Year field and save.
- Add a cover to an old book: edit it and use "Choose photo..."; the cover then shows in the first column of the list.

■ *Voltar ao Sumário*

Subjects and authors on file

Two indexes side by side, with the number of books for each subject and each author. They are both a way to see your collection from above and a one-click filter.

Passo a passo

1 Click the "Subjects and authors on file" heading to open or close the block.

2 Use "Filter subjects..." or "Filter authors..." to find an item in a long list.

3 Click a subject or an author: the list at the bottom of the page then shows only that item's books.

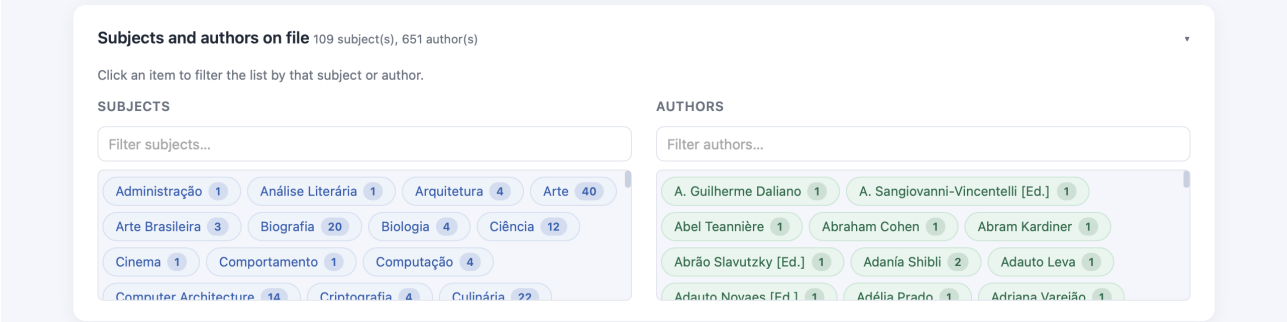

Figura 6: The subject and author indexes, each with its count

Exemplos de uso

- The number beside the name is how many books you have of that subject or author — "Arte 40" means forty books on Art.
- It is the quickest way to answer "how many books do I have by this author?" without typing anything.

■ *Voltar ao Sumário*

The map by country

Each bubble is a country, in its place on the world, and its size is how many books you have from there. Below it, the same counts as an ordered list. A book's country is where the literature comes from, not where the edition was printed: a Brazilian edition of Tolstoy counts as Russia.

Passo a passo

1 Click the "Map by country" heading to open the block.

2 Click a bubble to filter the book list by that country.

3 The line under the map says how many books already have a country and how many do not yet.

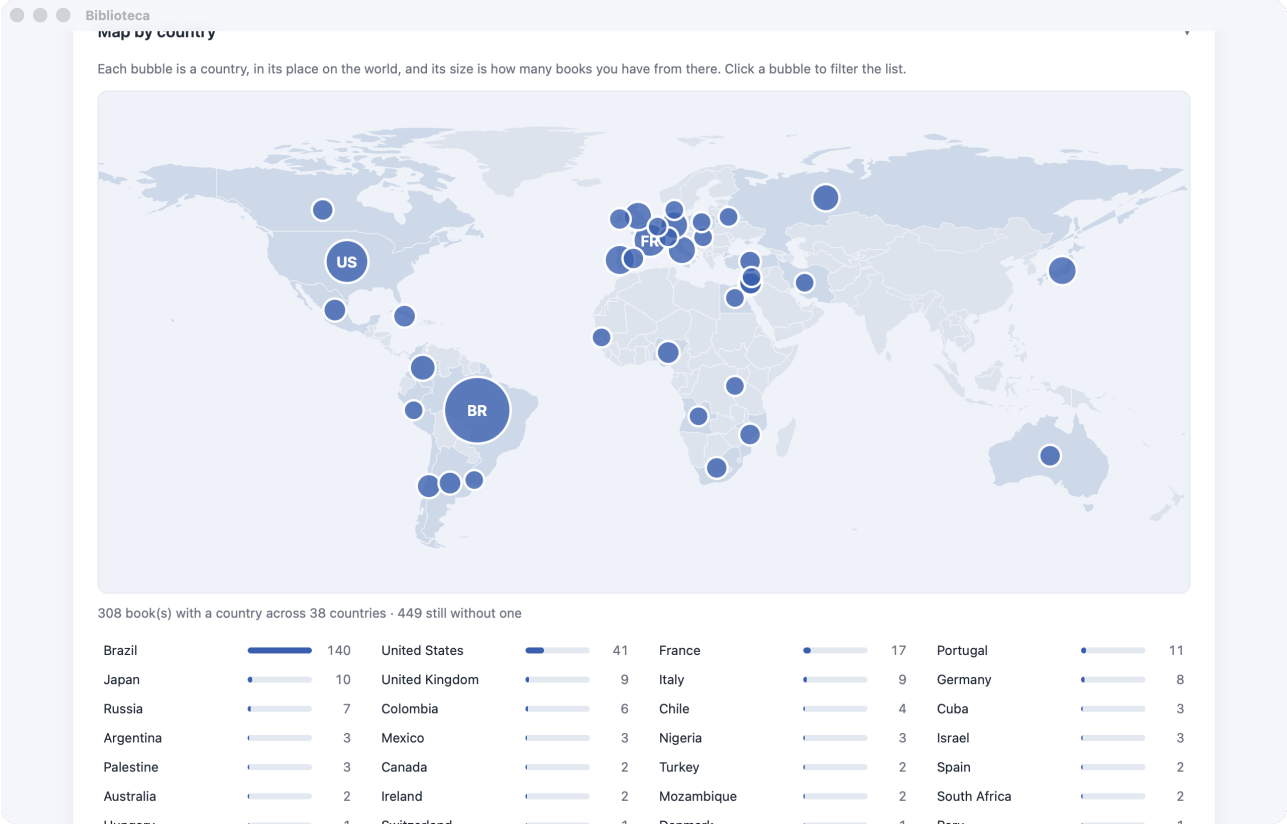

Figura 7: The map, one bubble per country, with the counts below

Exemplos de uso

- The country is optional, and the map does not expect every book to have one — it shows the count for those that do and says how many are still missing.
- To give a book a country, edit it and pick one in the Country field.

■ *Voltar ao Sumário*

The biblioteca.txt file

The "The biblioteca.txt file" band is where the app says which file it is working with and offers everything to do with it: reload, import, export and back up. It is also where the delete-everything button lives.

Passo a passo

1. The status line, at the top of the band, shows the file's full path and says that changes are saved automatically.
2. "Reload" reads the file from disk again — useful if you changed the library on another device and want that change here.
3. "Import (one-off)" reads a biblioteca.txt from somewhere else; "Import Excel (reading group)" reads a group spreadsheet.
4. "Export (one-off)" writes a copy of the catalogue wherever you choose.
5. "Export photos → iCloud Drive" takes the covers to the iCloud folder. It is this button that CREATES biblioteca.dat, the first time you use it.
6. "Backup" writes a dated copy into the Backups folder.

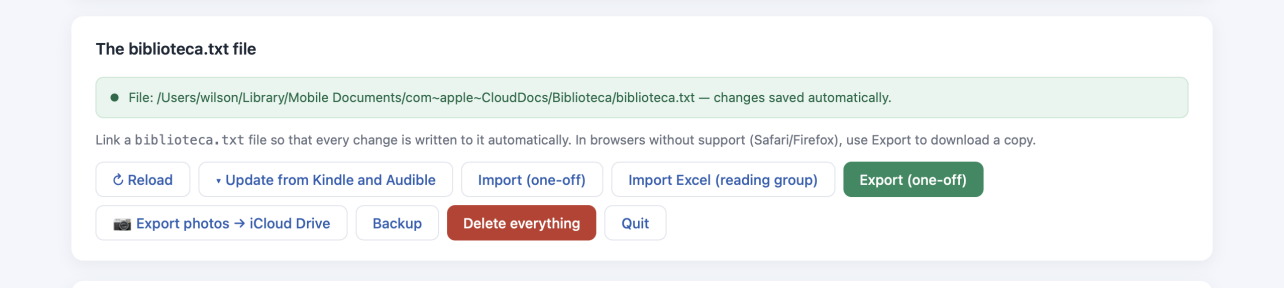

Figura 8: The file band, with import, export and backup

Exemplos de uso

- There is no save button: every change is written to the file the moment you make it.
- Before the first write of each session, the app keeps a copy of the previous state in Backups by itself — 30 generations of the .txt and 7 of the .dat.
- biblioteca.dat is the file where the Mac and the iPhone keep every cover, side by side with the .txt. Android READS it but does not write it: covers are published by this app and by the iPhone one.
- "Delete everything" is destructive and asks for confirmation. It empties the catalogue, not just the screen.

■ *Voltar ao Sumário*

The book list

The last block on the page is the table of books, ten to a page. It shows the cover, the title, the authors, the subjects, the year, the status, the location, the note and the groups — and carries, on every row, that book's action buttons.

Passo a passo

1. The count to the right of the heading says how many books are being shown out of the total — "757 of 757 book(s)" means no filter is active.
2. Use the pagination at the bottom of the table to move between pages.
3. "Edit" opens the book in the edit window.
4. "Lend" marks the book as on loan and asks who to.
5. "Print" produces that book's record.
6. "Remove" deletes the book, with confirmation.

Figura 9: The book table, with the covers and each row's buttons

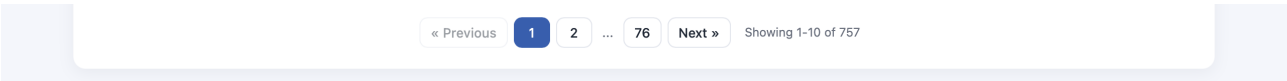

Figura 10: The pagination and the count, at the end of the table

Exemplos de uso

- When a book has a web address in its note, the column shows "Ler" and "Kindle" links, which open the book in the browser or in the Kindle app.
- The GROUP column shows the name of the reading group where the book was discussed, not just a "yes".
- Books with no cover show a grey book icon in place of the photo.

■ *Voltar ao Sumário*

Tutorial: from the .dmg to your first book with a cover

This is the whole path for someone who has never used the app and does not have a biblioteca.txt yet. At the end of it you come out with the file created, a book in it and the cover in place.

1. Download Biblioteca-Mac.dmg, open it and drag "Biblioteca Web" into Applications.
2. Open the app. The "Welcome" window appears.
3. Click "Choose or create a file". In the Mac's save window, go to iCloud Drive, create a folder called Biblioteca there, go into it, leave the name as biblioteca.txt and confirm. The file now exists.
4. In the "Add a book" block, type the ISBN from the back cover of a book you have at hand and click "Look up ISBN".
5. Check the title and authors that came back, add a subject and write in Where the copy is where the book sits — "Shelf 3", for instance.
6. Under "Cover photo", click "Choose photo..." and pick a picture of the cover.
7. Click "Add book". Scroll to the bottom of the page: the book is in the table, with its cover in the first column.
8. Go back to the "The biblioteca.txt file" band and click "Export photos → iCloud Drive". This is what creates biblioteca.dat, beside your .txt. From here on the iPhone can see the cover too.

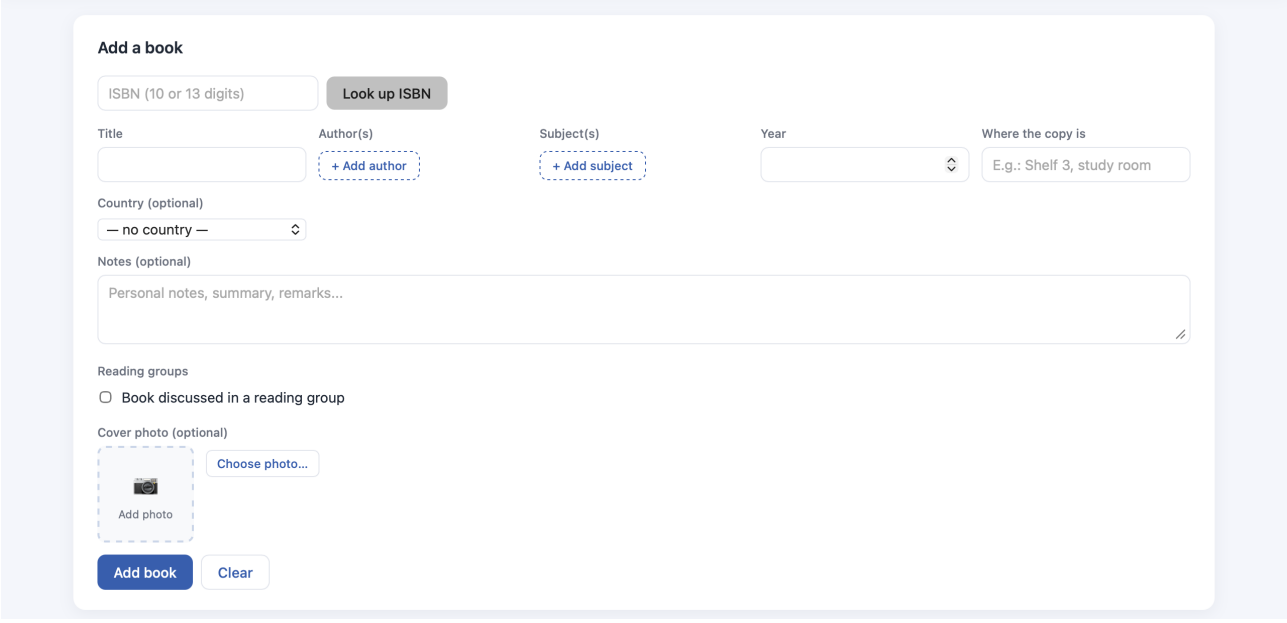

Figura 11: The form filled in, just before adding the book

■ *Voltar ao Sumário*

Solução de Problemas

I opened the app for the first time and I do not know how to create my biblioteca.txt.

You do not need to create it elsewhere. In the "Welcome" window, choose "Choose or create a file": the app opens the Mac's save window and creates the file wherever you say. If that window has gone, the same thing is under "Link folder", in "The biblioteca.txt file" band.

I do not have a biblioteca.dat. What am I missing?

Nothing. It only comes into existence once you have covers and use "Export photos → iCloud Drive". Without it the app works just the same; what does not happen is the iPhone and Android seeing your covers.

The app opened empty, but my library does exist.

It did not find the file. Go to "The biblioteca.txt file" band, click "Link folder" and point at the folder where your biblioteca.txt is. Do not add anything before doing that.

The app opens in English and my Mac is in Portuguese.

On first run the app follows the system language, and what it reads is the first language in Language & Region — which can be English even on a Mac used in Portuguese. Pick Português in the header selector: your choice wins from then on.

I changed the library on the iPhone and the Mac does not show it.

Click "Reload" in the file band. The app reads the file when it opens, not continuously — and iCloud also takes a few seconds to bring the new version across.

The ISBN lookup did not find the book.

That happens with old editions and small print runs, which are not in the databases consulted. Type the title by hand: nothing else depends on the ISBN.

I deleted a book by mistake.

There is a Backups folder beside your file, with 30 generations. Take the most recent one from before the mistake and use "Import (one-off)".

The "Welcome" window does not appear any more and I wanted to see it again.

It is a one-time thing: it appears while the app does not know any library of yours. Everything it offers is still available in "The biblioteca.txt file" band — linking, importing and exporting.

■ *Voltar ao Sumário*

Glossário

biblioteca.dat
The file of cover photos, beside the .txt. It is not born with it: it is created the first time you use "Export photos → iCloud Drive".

biblioteca.txt
The file where the catalogue lives. Plain text, one book per line, fields separated by tabs. It is the same file on all four platforms.

ISBN
The 10- or 13-digit number that identifies an edition. It is what the barcode on the back cover carries.

Link folder
Telling the app which folder your biblioteca.txt is in. Done once, the app remembers — and writes there on every change from then on.

Reading group
A mark for books discussed in a group, with the group's name. It works as a filter in search.

TSV
Tab-separated values. It is the format of biblioteca.txt, and it is what lets you open it in any editor or spreadsheet without depending on this app.

Where the copy is
Where your book physically is — the shelf, the box, the house of whoever borrowed it. Search looks in this field too.
